

How to do the planning:

- Get the requirement analysis of the project.
- Create Model of the website.
- Create a flow of data and process of website working.
- Create a Data Model Diagram.
- Markdown the function based of the data model and requirement with brief usecase.
- **Feasibility Prototyping (The Scientific Method):** Before finalizing your data models, you must test your highest-risk assumption. Can you actually force the LLM to output a perfect JSON schema every single time? If that fails, your entire data flow collapses.
- **System Architecture Design:** You mapped the data flow, but you missed mapping the infrastructure. You must define the exact boundary between the Node.js compute engine and the React render engine.
- **State Management & UI/UX Wireframing:** A process flow is not enough. For an interactive simulation, you must map out the exact
